○Description:

- We are designing an online food ordering system that lets our customers order through an application. The order is confirmed automatically by the application. The customer's order from a menu and the deliveryman delivers that order. The customers either pay by a credit/debit card or cash on delivery.
- It contains CUSTOMERs' details, DELIVERYMAN's details, MENU's details, ORDERs' details and PAYMENTs' details.
- Customer has unique ID, a name (first name and last name), phone number and address (city, area, street, building number and apartment number). A customer chooses from one menu and can make many orders.
- Deliveryman has unique ID, a name (first name and last name) and a phone number. A deliveryman can deliver many orders.
- Menu has food names and prices for the food. One menu can be chosen from many customers.
- Orders have unique ID, date of the order (date and time), estimated delivery time and the order details which contain one or more than one value (food name and quantity). One order is taken from one employee and is placed by one customer. It also has one payment.
- Payments are for the orders have a payment type, credit/debit card number and the total price of the order. A payment can be for one order only.
